Documentation prepared by Arnold, Christina M , acting as medical scribe for and in the presence of Dr. Lauterbach 2/25/15 08:08

All medical record entries made by the scribe were at my direction and in my presence. I have reviewed the chart and agree that the record accurately reflects my personal performance of the history, physical exam, medical decision making, and the emergency department course for this patient. I have also personally reviewed and agree with the discharge instructions and disposition.

EMR and Dragon Attestation - this medical document was created using an electronic medical record

system with Dragon computerized dictation system. Although this document has been carefully reviewed, there may still be some phonetic and typographical errors. These errors are purely typographical, due to imperfections of the software programs, and do not reflect any compromise in the patient's medical care.

This 33-year-old dialysis patient is extremely well known to us in the emergency department for numerous visits with nausea vomiting gastroparesis and also with a history of her multiple complications of diabetes was seen with nausea and vomiting last night. She was in good shape and the vomiting was brought under control and she was discharged as some many times previously. Her potassium was noted to be 4.9 in the department. She was discharged to the lobby and was apparently sitting there when she collapsed to the floor a code was called and our staff responded to the lobby to bring the patient back she's placed on a gurney and CPR started is no palpable pulses are detected she is placed in a critical care room him putting her on the gurney into the critical care room. CPR was continued she's intubated while the nurses are getting her hooked up to the monitors. On the cardiac monitor we see a narrow complex relatively bradycardic rhythm regular at perhaps 30. Given the critical nature of her dialysis port is accessed and her drugs are given via that route she's given calcium and bicarbonate based on the possibility of acute hyperkalemia. Is followed with epinephrine. On her initial ultrasound I can see valve motion within the heart but no significant wall motion. Following the epinephrine her heart rate speeds up and her contractility increases her blood pressure returns stopped and ultimately her heart rate is 150 slowly this drops back down to about 120. Her examination she is unresponsive she has the appearance of diabetes and renal failure, no pulses and agonal respiratory efforts. Dr.

Kang the intensivist is contacted and he comes down to see the patient and will admit her to the intensive care unit. The nephrologist are contacted.

Addendum: Lauterbach,Stewart A on 2/26/15 @ 11:10

I failed to note in the note below that this patient immediately after the patient was intubated, a large piece of food was aspirated from the ET tube. This was removed by Dan, our respiratory therapist. I question if she could have had an aspiration leading to hypoxia, and the collapse.
